

Brian Klippel
Support for classes 4 and 5

This argument applies for both class 4 and 5, as I believe smartphones simply put ARE personal computing devices. Whether or not they include a cellular radio should be irrelevant.

Being able to 'jailbreak' devices I own is the only recourse when said devices are locked and further control is required. This level of control, root admin permission, is required to perform operations such as firewall management, proper backup and restore, removal of questionable bundled software (such as CarrierIQ). These are but a few short examples. In some cases it is even to bypass anti-competitive restrictions, such as access to a competing media store.
