Exemption to Prohibition on Circumvention of Copyright Protection Systems for
Access Control Technologies

1201

I am here to say that "jailbreaking" your personal devices for reasons other than do not directly involve piracy should be legal. Jailbreaking is a practice enjoyed by many tinkerers and people who wish to personalize their devices more than the manufacturers allow. It also allow people to remove pieces of software coined "bloatware" for taking up space on a user's device, such as pre-installed applications from cellular telecoms and their affiliated partners. It also allows people to have more features for their devices, such as the latest tweaks for Apple Inc's Siri voice control system for their iPhone 4S device listed [here](#), [here](#), [here](#), and [here](#). Those tweaks give people abilities that would otherwise not be possible without, such as turning WiFi on and off from anywhere on there device using Siri. Jailbreaking also allows people to enable features on their devices that the manufacturer does not put on natively, such as Siri on the Apple iPhone 4 and Apple iPhone 3GS, the Apple 4th generation iPod touch, and the Apple 1st-generation and 2nd-generation iPads using a custom server that customers pay a small fee to companies for the service for or build their own server using free tools available publicly to anyone with an internet connection and an Ubuntu Linux computer or a virtual machine. Jailbreaking should remain legal and free.
